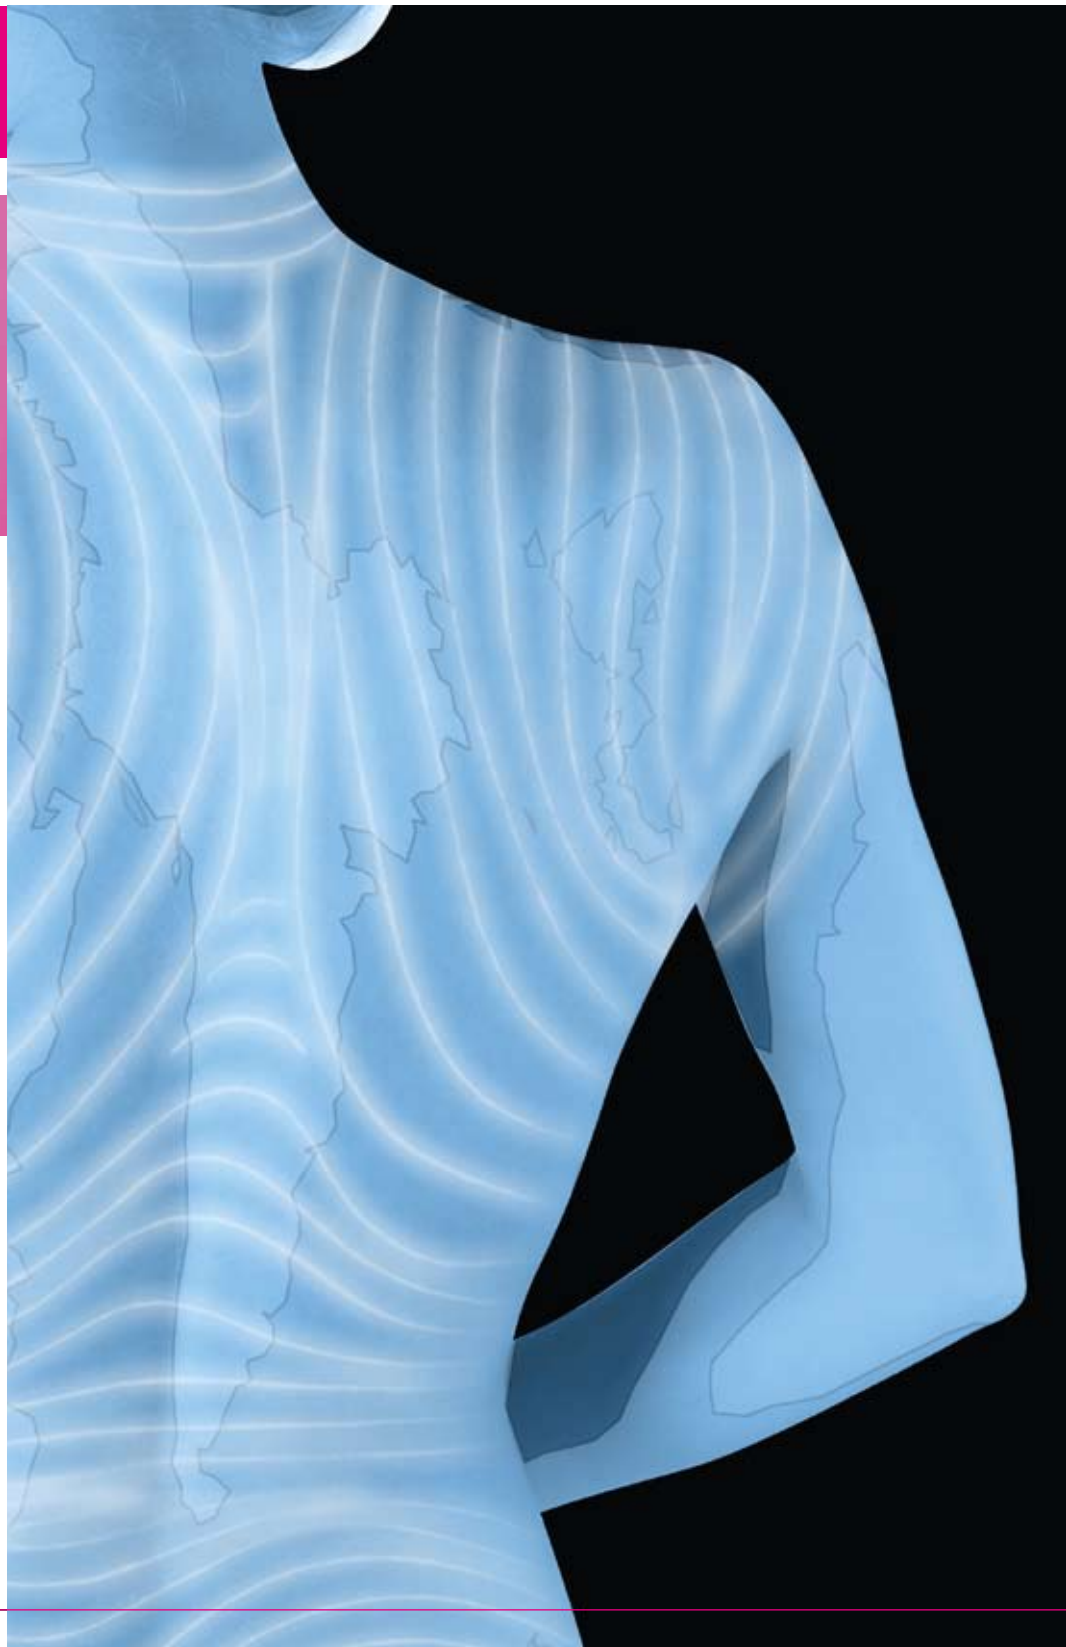
Surgical sutures for

SKIN CLOSURE

Surgical sutures



SERAG WIESSNER

Convincing down to the smallest detail

Decades of experience

High-tech and hand-crafted

For nearly 150 years, SERAG-WIESSNER has stood for surgical sutures of the highest quality. As the oldest established German manufacturer, the company combines decades of tradition with state-of-the-art technology. Extremely precise automated production technology is combined with the reliable and diligent work of our experienced employees. In addition, we work closely together with medical professionals in both clinical practice and research.
This results in an extensive range of top-quality suture materials for skin closure.

Non-absorbable sutures

SERALON® (blue and undyed)

Compared to other monofilament suture material, this non-absorbable polyamide thread is noticeably soft and smooth. It also possesses the tying effect important for knot security. Thanks to its ease of use, SERALON® has been successfully used as a skin suture for decades.

SUPRAMID (black and undyed)

SUPRAMID has excellent knot placement and is greatly valued for its lack of capillarity (comparable to monofilaments).

SERAPREN® (blue)

This monofilament, non-absorbable, polypropylene thread can also be recommended for skin sutures due to its smooth, non-porous surface.

SERALENE® (blue)

Due to its smooth, non-porous surface, this non-absorbable thread guarantees optimal sliding properties in the tissues. The substance PVDF is related to PTFE.

Suture material

Absorbable threads

SERA**FIT**® (violet and undyed) /
SERA**PID**® (undyed)

These materials are braided, absorbable threads made from polyglycolic acid with a special coating. They are suitable for intracutaneous skin closure.

SERA**FAST**® (violet and undyed)

This synthetic and absorbable monofilament thread made from polyglycolic acid-caprolactone is particularly suitable for indications with a short wound-healing phase.

SERA**SYNTH**® (violet)

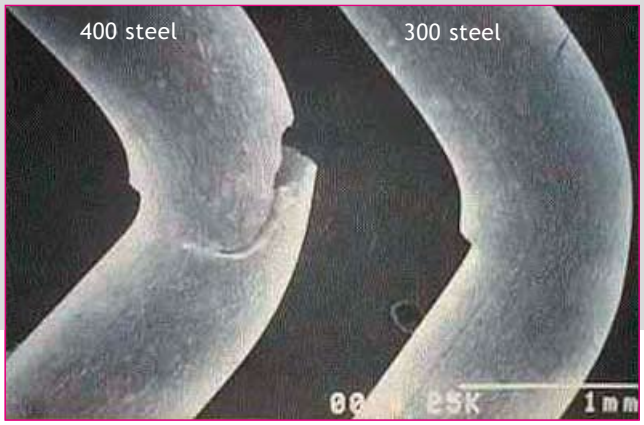
This polydioxanone thread belongs to the group of absorbable materials. The monofilament is characterised by its excellent sliding properties and high linear and knot tensile strength.

Intracutaneous suture incutifix®

incutifix® intracutaneous sutures are used where optimal cosmetic effects are required. At both the needle entry and exit points, the non-absorbable, monofilament thread is fixed with a clip. The thread runs parallel to the surface through the corium.

Intracutaneous suture

incutifix® - a considerable simplification of thread anchoring of intracutaneous sutures through the use of special clips



SERAG-WIESSNER 300 steel needles have very high ductility and low penetrating forces.

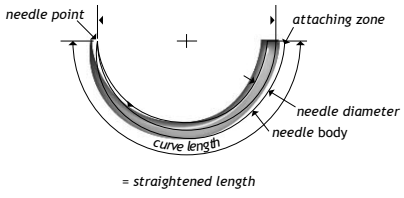
Needles

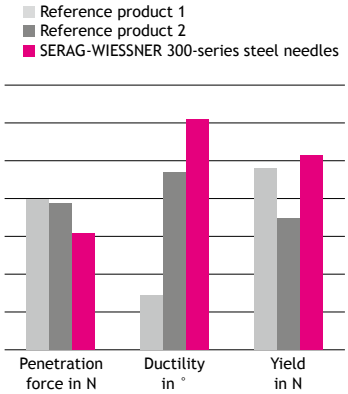
Needle shape
D = $^3/_8$ circle

Needle cross-section
S = cutting needle

Special characteristics
S = slim point

Example: DSS 18
$^3/_8$ circle
cutting needle
slim point
18 mm long (straightened length)





Needles

Our atraumatic needles are stainless steel needles with high flexural resistance and outstanding penetration capacity, thus permitting safe and easy work.

The designation of our atraumatic needles uses a combination of letters and numbers as recommended by the Technical Committee of the Association of Surgical Suture Manufacturers. The first two letters denote the needle shape and cross-section. A third or even fourth letter indicates special characteristics of the needle. The number following the letters gives the needle length (true length when straightened out).

Penetration force

DSS needles, our best needle generation for skin closure, have a particularly sharp point. This leads to considerably lower penetration forces and much smaller puncture sites than with conventional needles. The diagrams below left illustrate the corresponding comparisons made by our test laboratory.

▼ reverse cutting needle

▽ reverse cutting needle with special point
